We were fortunate to have [Solar Design Associates](#) working on this project from the ground up. President Steven Strong (seen on the left) is recognized world-wide as a visionary in this field.

Architect Steven Strong Steven's involvement in solar power goes back to the oil embargo days of the '70s. He had just come back from work on the Alaska Pipeline when he realized there had to be a better way to generate power.

Recently, the U.S. Department of Energy appointed Steven Strong US representative to the International Energy Agency as part of a five-year international collaboration on the development of PV systems for buildings. Representatives from some 15 countries including Japan, Switzerland, Canada, the UK and Germany are working together to further the knowledge base through the construction and evaluation of PV-powered demonstration buildings in each country.
